BLOCK CI-705

Plays Description:

- The block is mainly characterized by Albian structural closures. Others structural prospects have not been tested yet, like Barracuda south. Reservoirs are found from the Albian to Maastrichtian intervals.
- K1-1X, K1-2X and Barracuda-1X, encountered good thick sand in the lower cretaceous (Albian) and Upper Cretaceous (Cenomanian to Maastrichtian) sections.
- The fluid inclusion study of Barracuda-1X prove the migration of the hydrocarbon through the structure. Ongoing geochemical studies indicate the presence of mature source rocks in the Albian and Cenomanian sections.
